# 1. Keyboardemulator Development Abstract

## 1.1 Development Intro

This document mainly describes how to control the whole scanning process through the code control device with its own Keyboardemulator. Keyboardemulator is the code scanning software of the device. In the actual development, the keyboard assistant is used to obtain the scanning data and set other scanning options.

## 1.2 Intended For

Software developers

Software tester

## 1.3 IDE

Android Studio

## 1.4 Development Steps

-->Get the tool class barcodeutility to control the keyboardemulator through the SDK and instantiate it.

-->Set the relevant parameters of keyboardemulator scanning through the method of tool class.

-->The scan value is obtained by registering the broadcast.

## 2. API

This document mainly describes the common related methods of barcodeutility class, which is applicable to the control operation of keyboardemulator. For more details, please refer to the API document.

### 2.1 open()

|                      |   |
|----------------------|---|
| Interface            | public void open(Context context,BarcodeUtility.ModuleType modul) |
| Function Description | Switch On scanning function                                       |
| Para. Description    | context   |

|        |  |
|--------|--|
|        | Value: context object<br>modul<br><br>Value:<br>BARCODE_1D<br><br>BARCODE_2D<br>BARCODE_2D_H |
| Return | void   |

## 2.2 close()

|                      |  |
|----------------------|--|
| Interface            | public void close(Context context,BarcodeUtility.ModuleType modul)                                       |
| Function Description | Switch OFF barcode scanning  |
| Para. Description    | context<br><br>Value: context object<br>module<br><br>Value:<br>BARCODE_1D<br>BARCODE_2D<br>BARCODE_2D_H |
| Return               | void   |

## 2.3 startScan()

|                      |  |
|----------------------|--|
| Interface            | public void startScan(Context context,BarcodeUtility.ModuleType modul) |
| Function Description | Start Scanning   |
| Para. Description    | context<br><br>Value: context object<br>modul                          |

|        |  |
|--------|--|
|        | Value:<br>BARCODE_1D<br>BARCODE_2D<br>BARCODE_2D_H |
| Return | void   |

## 2.4 stopScan()

|                      |   |
|----------------------|---|
| Interface            | public void stopScan(Context context,BarcodeUtility.ModuleType modul)                           |
| Function Description | Stop Scanning   |
| Para. Description    | context<br>Value: context object<br>modul<br>Value:<br>BARCODE_1D<br>BARCODE_2D<br>BARCODE_2D_H |
| Return               | void  |

## 2.5 setOutputMode()

|                      |  |
|----------------------|--|
| Interface            | public void setOutputMode(Context context,int mode)                |
| Function Description | OFF scan   |
| Para. Description    | context<br>Value: context object<br>mode<br>Value:<br>0: on cursor |

|        |  |
|--------|--|
|        | 1: clipboard<br>2: broadcast<br>3: HID |
| Return | void                                   |

## 2.6 setScanResultBroadcast()

|                      |   |
|----------------------|---|
| Interface            | public void setScanResultBroadcast(Context context,java.lang.String broadcastAction,java.lang.String extraName)   |
| Function Description | Set the broadcast to receive scan data  |
| Para. Description    | Context<br>Value: context object<br>broadcastAction<br>Value:<br>Action of receiving scanning data<br>ExtraName<br>Value:<br>The name of the data item returned by intent |
| Return               | void  |

## 2.7 stopScan()

|                      |  |
|----------------------|--|
| Interface            | public void enableEnter(Context context,boolean isEnter) |
| Function Description | Enable Enter   |
| Para. Description    | context<br>Value: context object                         |

|        |   |
|--------|---|
|        | isEnter<br><br>Value:<br><br>true Enable<br><br>false disable |
| Return | void  |

## 2.8 stopScan()

|                      |   |
|----------------------|---|
| Interface            | public void enableTAB(Context context,boolean isTab)  |
| Function Description | Enable TAB  |
| Para. Description    | context<br><br>Value: context object<br><br>isTab<br><br>Value:<br><br>true Enable<br><br>false Disable |
| Return               | void  |

## 2.9 setReleaseScan

|                      |   |
|----------------------|---|
| Interface            | public void setReleaseScan(Context context,boolean enable)        |
| Function Description | Release Key Stop Scan?  |
| Para. Description    | Context<br><br>Value: context object<br><br>enable<br><br>Values: |

|        |                                  |
|--------|----------------------------------|
|        | true Stop scan<br>false Not stop |
| Return | void                             |

## 2.10 enablePlaySuccessSound()

|                      |  |
|----------------------|--|
| Interface            | public void enablePlaySuccessSound(Context context,boolean isSuccessSound)                         |
| Function Description | Play success sound?  |
| Para. Description    | Context<br>Value: context object<br>enable<br>value:<br>true play sound<br>false not to play sound |
| Return               | void   |

## 2.11 enablePlayFailureSound()

|                      |  |
|----------------------|--|
| Interface            | public void enablePlayFailureSound(Context context,boolean isFailureSound)                         |
| Function Description | Play failure sound?  |
| Para. Description    | Context<br>Value: context object<br>enable<br>Value:<br>true Play sound<br>false Not to play sound |
| Return               | void   |

## 2.12 setPrefix()

|                      |  |
|----------------------|--|
| Interface            | public void setPrefix(Context context,java.lang.String prefix) |
| Function Description | prefix   |
| Para. Description    | Context<br>Value: context object<br>enable<br>Value:<br>Prefix |
| Return               | void   |

## 2.13 setSuffix()

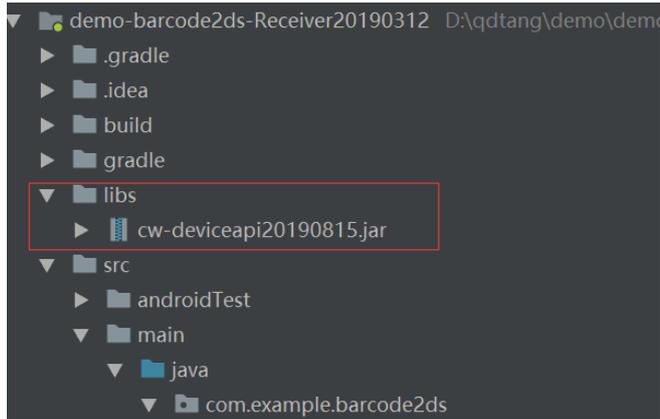

|                      |  |
|----------------------|--|
| Interface            | public void setSuffix(Context context,java.lang.String suffix) |
| Function Description | Suffix   |
| Para. Description    | Context<br>Value: context object<br>suffix<br>Value: suffix    |
| Return               | void   |

## 3. Operation Description

### 3.1 Import jar.

A\ Build Android Studio development environment

B\ Add CW- deviceapi.jar Copy to LIBS directory and import

**Note: Latest API version will be upgraded, please download from our website according to model.**

## 3.2 Use operation

### 3.2.1 Registering Broadcast:

```
barcodeDataReceiver=new BarcodeDataReceiver();
IntentFilter intentFilter = new IntentFilter();
intentFilter.addAction("com.scanner.broadcast");
context.registerReceiver(barcodeDataReceiver, intentFilter);
```

### 3.2.2 Receive Data:

```
class BarcodeDataReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        String barCode = intent.getStringExtra( name: "data");
        String type = intent.getStringExtra( name: "CODE_TYPE");
        if (barCode != null && !barCode.equals("")) {
            // success tvData.setText(barCode);
        } else {
            barCode="Scan fail";
            //fail tvData.setText("Scan fail");
        }
        if(iBarcodeResult!=null)
            iBarcodeResult.getBarcode(barCode + "\n" + type);
        SoundManage.PlaySound(context, SoundManage.SoundType.SUCCESS);
    }
}
```

### 3.2.3 Parameters Setup:

Instantiation tool class:

```
public Barcode2D() {  
    barcodeUtility= BarcodeUtility.getInstance();  
}
```

Set scan parameters:

```
barcodeUtility.setOutputMode(context, mode: 2); //设置广播接收数据  
barcodeUtility.setScanResultBroadcast(context, broadcastAction: "com.scanner.broadcast", extraName: "data"); //设置接收数据的广播  
barcodeUtility.open(context, BarcodeUtility.ModuleType.BARCODE_2D); //打开2D  
barcodeUtility.setReleaseScan(context, enable: false); //设置松开扫描按键，不停止扫描  
barcodeUtility.setScanFailureBroadcast(context, enable: true); //扫描失败也发送广播  
barcodeUtility.enableContinuousScan(context, isContinuous: false); //关闭键盘助手连续扫描  
barcodeUtility.enablePlayFailureSound(context, isFailureSound: false); //关闭键盘助手 扫描失败的声音  
barcodeUtility.enablePlaySuccessSound(context, isSuccessSound: false); //关闭键盘助手 扫描成功的声音  
barcodeUtility.enableEnter(context, isEnter: false); //关闭回车
```

## Start / stop scanning

```
//开始扫码
public void startScan(Context context){
    if(barcodeUtility!=null) {
        Log.i(TAG, msg: "ScanBarcode");
        barcodeUtility.startScan(context, BarcodeUtility.ModuleType.BARCODE_2D);
    }
}
//停止扫描
public void stopScan(Context context){
    if(barcodeUtility!=null) {
        Log.i(TAG, msg: "stopScan");
        barcodeUtility.stopScan(context, BarcodeUtility.ModuleType.BARCODE_2D);
    }
}
```
